## 1. Mixing loops made simple

Grundfos MIXIT is an all-in-one mixing loop for heating and cooling systems.

MIXIT is controlled by a built-in actuator and controller and it offers the following:

- a uniquely designed valve for precise flow-temperature control due to real-time sensor measurements, even at low flow, ensuring stable control
- modified equal percentage characteristic for linear heat power regulation
- easy setup and a completely integrated temperature control solution tailored to your specific application
- flexible offerings in both applications, and features designed to accommodate your needs
- one connection for all data points on the system, pump and MIXIT unit.

### A complete mixing loop with only two components

With MIXIT the complexity of the traditional mixing loop is vastly reduced, as MIXIT allows you to build a complete mixing loop with only two components:

1. MIXIT, a highly intelligent valve unit with integrated non-return valve (threaded versions), actuator and sensors
2. MAGNA3, a best-in-class circulator pump.

This makes designing, installing and operating mixing loops incredibly simple and easy. Also, because MIXIT is designed to communicate with the MAGNA3 pump via Grundfos GLoWPAN radio signal, no additional wiring or control unit is needed.

In traditional mixing loops, the components needed for a mixing loop are supplied from different vendors. With MIXIT you get single point of warranty and competent technical support for the entire MIXIT system.

### Traditional mixing loop vs. the MIXIT system

TM071467

Left: Traditional setup. Right: MIXIT system.

## Features

- All-in-one, plug-and-play solution eliminating any uncertainties found in a traditional mixing-loop setup.
- Integrated actuator and controller.
- Built-in temperature and flow sensors.
- Pressure independent control valve with balancing function.
- Integrated, removable non-return valve in threaded versions. Non-return valves are available as an accessory for flange versions.
- Valve and pump settings to match your application, ensuring a more effective application control.
- Fast and simple installation and setup.
- Intuitive and simple operating panel.
- Easy configuration with the Grundfos GO Remote app.
- Built-in fieldbus (BACnet, Modbus or GENibus) for easy integration into building management systems (BMS).
- Insulating shells for heating systems according to ENeV supplied with the product.

As MIXIT is a pre-fabricated, complete mixing loop with integrated control functions, only two power cables are required for the MIXIT system to work. The compact design ensures a maximum utilisation of space and a tidy and compact installation.

The MIXIT system can operate as follows:

- as a standalone mixing loop in buildings without any additional equipment
- as a subsystem in larger building controlled by a BMS system.

### Related information

[Non-return valve](#)

[Sensors](#)

[Operating panel for MIXIT](#)

## Temperature control

The built-in temperature control controls the secondary flow temperature. The controller adjusts the position of the valve according to the setpoint and measured temperatures, and it acts according to the application. The setpoint can be set on the operating panel, in Grundfos GO Remote or via fieldbus.

In radiator and underfloor heating systems the controller will control the mixed flow temperature.

In heating-coil applications it will control the air temperature leaving the heating coil. The temperature is measured by an external sensor, which is available as an accessory.

### Related information

[Temperature sensors](#)

## Controlling MIXIT

Setting up and controlling a mixing loop have never been easier. This is done via MIXIT's operating panel and Grundfos GO Remote. With Grundfos GO Remote you can do the following:

- Configure whether MIXIT must operate as a two- or three-way valve.
- Define the application type, allowing you to activate settings, which are typically found beneficial in the given system.
- Set functions such as outdoor temperature compensation, primary flow balancing and thermal power limit.
- Monitor the operating status.
- Schedule an operating pattern and set warm-weather shutdown.
- Unlock and download upgrades.

Via wireless communication, the MIXIT valve unit takes control over the MAGNA3 pump, which means that no additional wiring between MIXIT and the pump is needed.

## Applications

MIXIT is a control valve with actuator and built-in unit control.

Besides a control valve, MIXIT also includes sensors and an integrated non-return valve (only threaded versions). The actuator is incorporated in a control box together with a control unit which controls both the actuator and the pump.

MIXIT can be used in mixing loops in all heating and cooling systems where there is a need to control the flow temperature, such as radiator heating, underfloor heating and air handling units.

MIXIT is perfect for new installations or complete renovations in commercial buildings as replacement for traditional mixing loops.

MIXIT can either operate as a stand-alone system or as a subsystem in installations controlled by a BMS system.

## Compatibility

MIXIT is compatible with MAGNA3 model D pumps with production code from 1943 (YYWW) and onwards.

## 2. Performance range

MIXIT	B-port orientation	Connection	G [inch]	PN	K <sub>vs</sub> value, A and B port [m <sup>3</sup> /h]*	Minimum settable flow limit [m <sup>3</sup> /h]**
DN 25-6.3	Left	Threaded	G 1 1/2	PN 10	6.3	0.3
DN 25-6.3	Right	Threaded	G 1 1/2	PN 10	6.3	0.3
DN 25-10	Left	Threaded	G 1 1/2	PN 10	10	0.5
DN 25-10	Right	Threaded	G 1 1/2	PN 10	10	0.5

DN 50-40	Right	Flange		PN 6/10	40	2

\* The K<sub>vs</sub> value represent the water in m<sup>3</sup>/h at a differential pressure of 1 bar from port A to AB.

\*\* The DYNAMIC upgrade is required to set a flow limit.

### B-port orientation

All MIXIT valve units are available with either right or left B-port orientation.

TM071426

### Applicable MAGNA3 pumps

The pump size best suited for your application is determined based on the desired secondary flow. MIXIT is typically coupled with the MAGNA3 variants listed below.

#### Single-head pumps

- 25-40/60/80/100/120
- 32-40/60/80/100/120
- 32-40/60/80/100/120 F
- 40-40/60/80/100/120/150/180 F
- 50-40/60/80/100/120/150/180 F
- 65-40/60/80/100/120/150 F

#### Twin-head pumps

- 32-40/60/80/100
- 32-40/60/80/100/120 F
- 40-40/60/80/100/120/150/180 F
- 50-40/60/80/100/120/150/180 F
- 65-40/60/80/100/120/150 F

## Performance curves

The following figures show the flow characteristics and performance ranges of the MIXIT variants and applicable pumps, which can be used as guidance for sizing and selecting your MIXIT system.

### Settable flow range

TM071488

Settable flow range for MIXIT operating as a pressure independent, balancing, two-way valve at  $\Delta p_{v100} = 20 \text{ kPa}$

Axis	Value
Y	Primary flow, Q [l, h]
X	MIXIT variant

The graph shows the settable flow range for MIXIT operating as a pressure independent, balancing, two-way valve.

Maximum flow is given for a  $\Delta p_{v100} = 20 \text{ kPa}$ .

## Two-way valve

Performance range for two-way MIXIT valve at  $\Delta p_{v100} = 20 \text{ kPa}$

Axis	Value
Y	Heat load, $\Phi$ [kW]
X	Secondary flow, $Q_s$ [m³/h]

The figure shows the relationship between flow and heat load at various values of  $\Delta T$ . The stippled, coloured areas indicate the range of each available valve size.

## Three-way valve

TM071489

Performance range for three-way MIXIT valve at  $\Delta p_{v100} = 6 \text{ kPa}$

Axis	Value
Y	Heat load, $\Phi$ [kW]
X	Secondary flow, $Q_s$ [m³/h]

The figure shows the relationship between flow and heat load at various values of  $\Delta T$ . The stippled, coloured areas indicate the range of each available valve size.

### 3. Guide to selection and sizing

In order to select the optimal valve and pump size, you need to determine the required valve capacity and flow rate for your system.

#### Selecting the correct pump size

When you have sized the valve, you can select the appropriate pump size based on the desired secondary flow and the head required to overcome secondary side head losses.

MAGNA3 pumps applicable for MIXIT can be found in [2. Performance range](#).

#### Valve selection using performance range curves

MIXIT performance range curves offer a simple selection tool, provided that the pressure differential across the fully open valve in your application matches one of these performance range curves:

Two-way valve with pressure differential  $\Delta p_{v100} = 20$  [kPa]

Three-way valve with pressure differential  $\Delta p_{v100} = 6$  [kPa]

1. Determine two out of three of these parameters:

- heat load  $\Phi_s$  [kW]
- secondary flow  $Q_s$  [m<sup>3</sup>/h].
- secondary temperature difference  $\Delta T_s$ .

If you need to calculate some of the parameters above, use the step-by-step guide. See [3.3 Step-by-step valve sizing guide](#).

2. You can go to the relevant performance range curve and select the MIXIT variant that matches your application. See [2.1 Performance curves](#).

#### Valve sizing based on calculations

The most accurate way to size the valve is to calculate the required valve capacity for your system design flow and match it with the equivalent  $K_{vs}$  from our performance range.

#### $K_v$

$K_v$  represents the valve capacity measured as the flow of water in m<sup>3</sup>/h at a pressure differential of 1 bar across the valve, with the valve open at any position.

#### $K_{vs}$

$K_{vs}$  is the maximum  $K_v$  value measured when the valve is fully open (100%).

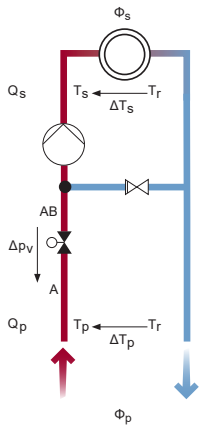

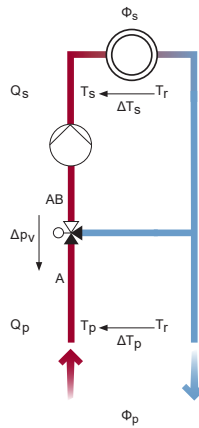

For MIXIT,  $K_{vs}$  is measured from port A to AB.

1. Use the step-by-step guide below to determine the required valve capacity  $K_v$  for your system design. See [3.3 Step-by-step valve sizing guide](#).
2. Go to the performance range table and select a valve within the  $K_{vs}$  value range that matches the calculated  $K_v$  value. See [2. Performance range](#).

## Step-by-step valve sizing guide

The table below shows examples of applications and parameters used for calculating the correct valve size.

	Example 1 Injection circuit with a two-way valve	Example 2 Mixing circuit with a three-way valve
<p>Primary side:</p> <p><math>\Phi_p</math>: Load [kW]</p> <p><math>Q_p</math>: Primary flow [m<sup>3</sup>/h]</p> <p><math>T_p</math>: Supply temperature [°C]</p> <p><math>T_r</math>: Return temperature [°C]</p> <p>Secondary side:</p> <p><math>\Phi_s</math>: Load [kW]</p> <p><math>Q_s</math>: Secondary flow [m<sup>3</sup>/h]</p> <p><math>T_s</math>: Forward temperature [°C]</p> <p><math>T_r</math>: Return temperature [°C]</p> <p><math>\Delta p_v</math>: Pressure differential across the valve [kPa]</p>

	Example 1 Injection circuit with a two-way valve	Example 2 Mixing circuit with a three-way valve
<b>4A.1 Determine the pressure differential</b> $\Delta p_{V100}$ = required pressure drop across the fully open valve. Typical design pressure drop: <ul style="list-style-type: none"> <li>Two-way valve in pressurised distribution system: <math>\Delta p_{V100}</math> = 10 kPa (typical value)</li> <li>Three-way valve in pressure-less system: <math>\Delta p_{V100}</math> = 6-8 kPa. (Sized by <math>K_{VS}</math> value)</li> </ul>	Example: $\Delta p_{V100}$ = 10 [kPa]	Example: $\Delta p_{V100}$ = 6 [kPa]
<b>4A.2 Calculate the required valve capacity <math>K_V</math> in m<sup>3</sup>/h</b>  $K_V = \frac{Q_p}{\sqrt{\frac{\Delta p_{V100}}{100}}}$	$K_V = \frac{4.3}{\sqrt{\frac{10}{100}}}$  $K_V = 13.6 \text{ [m}^3/\text{h]}$	$K_V = \frac{2.3}{\sqrt{\frac{6}{100}}}$  $K_V = 9.4 \text{ [m}^3/\text{h]}$
<b>4A.3 Select valve</b> Go to the performance range table and select a valve within a $K_{VS}$ range that matches your calculated $K_V$ value. Select the closest match, which provides the most economical valve that ensures sufficient valve authority. Find the table in <a href="#">2. Performance range</a> .  When MIXIT is installed, you can control the valve position via Grundfos GO Remote to match the required pressure differential $K_V$ for your system design.	MIXIT DN 32-16: $K_{VS}$ value: 1.6 - 16 [m <sup>3</sup> /h] Flow range: 0.8 - 8.8 [m <sup>3</sup> /h]	MIXIT DN 25-10: $K_{VS}$ value: 1 - 10 [m <sup>3</sup> /h] Flow range: 0.5 - 5.5 [m <sup>3</sup> /h]
<b>4B. Settable flow range graph</b> Use the settable flow range graph to size and select your MIXIT variant. Find the graph in <a href="#">2.1 Performance curves</a> . Typical design pressure drop: <ul style="list-style-type: none"> <li>Pressure independent valves: <math>\Delta p_{V100}</math> = 15-25 kPa. (Sized by flow). Please note that MIXIT does not require any minimum pressure differential to function as a pressure independent valve.</li> </ul>	Valid for pressure independent two-way valves with balancing and with a pressure differential $\Delta p_{V100}$ equal to 20 [kPa].  Example: Flow $Q_p$ = 4.3 [m <sup>3</sup> /h] = 4300 [l/h]  Selection via settable flow range graph: MIXIT DN 25-10 Flow range: up to 4500 [l/h]  When MIXIT is installed, you can control the valve position via Grundfos GO Remote and set the flow limit to match the required pressure differential $K_V$ for your system design.	Not applicable for three-way valves.

## 4. System applications

Mixing loops are used whenever there is a need for controlling the flow temperature. The basic principle is to mix the primary water with the return water to obtain the required mixed flow temperature. When it comes to MIXIT, it can be used in HVAC systems with the following types of consumers:

- Radiator heating
- Underfloor heating
- Air handling unit

When applied to a primary distribution circuit, the heating system acts as a secondary circuit. In a temperature-controlled circuit, different types of mixing circuits are used. MIXIT can be applied to the following three circuit types working either as a two- or three-way valve:

### Pressurised distribution circuits

- Injection circuit with a two-way valve
- Injection circuit with a three-way valve

### Non-pressurised distribution circuit

- Mixing circuit with a three-way valve.

## System integration

Thanks to the integrated fieldbus, MIXIT can be incorporated into any building management system (BMS) using the RS485 terminal or ethernet port.

### RS485

- BACnet MS/TP protocol
- Modbus RTU protocol.

### Ethernet

- BACnet IP protocol
- Modbus TCP protocol
- Grundfos BuildingConnect.

### Related information

[Fieldbus integration](#)

[Setting up the product using Grundfos GO Remote](#)

## Distribution circuits

### Injection circuit with a two-way valve

Pos.	Description
1	Primary system
2	Secondary system

This type of mixing circuit is the most common one in all new installations.

The injection circuit operates with a variable flow on the primary side (1) and a constant flow on the secondary side (2).

Hot water is injected through a two-way valve into the secondary system (2) by opening the valve. On the secondary side (2), cold water from the return pipe is mixed in through a bypass. The more water injected from the primary side (1), the less water is flowing through the bypass, resulting in a constant flow with a variable temperature at the load.

Because the bypass acts as a hydraulic short circuit, the pump in the secondary system (2) is not able to pump the water into the primary circuit. Therefore, this type of circuit is always pressurised in the primary system (1).

## Injection circuit with a three-way valve

Pos.	Description
1	Primary system
2	Secondary system

This type of circuit is advantageous when a fast response time is required and is often found in systems with long distances between heat generation and load. Because the flow and temperature in the primary system (1) are constant, the temperature in the secondary system (2) will increase instantly when water from the primary circuit is injected. The circuit is rarely used, though, as part of the primary flow is recirculated, and it is not applicable for district heating and condensing boiler because of the potential high temperatures in the system.

## Mixing circuit with a three-way valve

Pos.	Description
1	Primary system
2	Secondary system

The mixing circuit with a three-way valve is typically used in systems where the heat source allows a variable flow through it. Under these conditions, it is not necessary to have a primary pump. For this reason, this mixing circuit is not valid in applications where the boiler is far away from the valve.

The mixing circuit operates with a variable flow on the primary side (1) and a constant flow on the secondary side (2).

In this circuit, hot water is led through a three-way valve into the secondary system (2). Part of the secondary flow is recirculated through the valve. The two flows are mixed together at the mixing point inside the valve.

### Fixed bypass in a mixing circuit with a three-way valve

When the primary flow temperature is significantly higher than the maximum secondary flow temperature, we recommend that you use the three-way mixing circuit with a fixed bypass. This is because the bypass ensures injection of return water even in the rare event of power failure or a stuck valve.

## MIXIT in a radiator heating system

TM072873

Example of external connections in a radiator heating system

Pos.	Description
1	Bluetooth connection to smartphone via Grundfos GO Remote
2	Integration into BMS system
3	Outdoor temperature sensor (Pt1000)

In radiator heating systems, MIXIT will control the flow temperature supplied to the radiators. It can be used in both one- and two-pipe radiator installations. We recommend that you use thermostats on the individual radiators to set the desired room temperatures.

In the installation example above, MIXIT is configured with an outdoor temperature sensor, which is perfect for utilising the following features:

- outdoor temperature compensation
- warm-weather shutdown.

### Data

MIXIT receives data on the mixed flow temperature from the pump's temperature sensor, while MIXIT itself measures:

- flow and temperature of the A port
- temperature of the B port.

These data can be used for the following features:

- temperature control
- pressure independence
- return temperature limit
- thermal power limit
- heat monitor.

	Earth		
	N		

### Configuring the I/O terminals according to the terminal connections table

TM074677

## MIXIT in a underfloor heating system

TM072874

Example of external connections in a underfloor heating system

Pos.	Description
1	Bluetooth connection to smartphone via Grundfos GO Remote
2	Integration into BMS system
3	Outdoor temperature sensor (Pt1000)
4	Temperature protection switch (extra thermal protection)

In underfloor heating systems, MIXIT will control the flow temperature supplied to the connected underfloor heating zones.

In the installation example above, MIXIT is configured with the following:

- An outdoor temperature sensor, perfect for utilising the following features:
  - outdoor temperature compensation
  - warm-weather shutdown.
- A bimetallic temperature protection switch providing thermal protection. Once a defined maximum temperature is reached, the temperature switch activates the input terminal of the MIXIT unit causing the valve to close. The switch acts as extra protection as MIXIT already controls the mixed flow temperature and has a built-in floor overheat protection function. See [6.2 Underfloor overheat protection](#).

### Data

MIXIT receives data on the mixed flow temperature from the pump's temperature sensor, while MIXIT itself measures:

- flow and temperature of the A port
- temperature of the B port.

These data can be used for the following features:

- temperature control
- pressure independence
- return temperature limit
- thermal power limit
- heat monitor.

## MIXIT in an air handling unit system

TM072875

Example of external connections in an air handling unit

Pos.	Description
1	Bluetooth connection
2	System integration
3	Outdoor temperature sensor (Pt1000)
4	Air temperature sensor
5	Antifreeze sensor (extra protection against freezing)

In air handling unit systems, MIXIT will control the flow temperature supplied to the air coil placed within the air handling unit. The flow temperature will be determined by the setpoint of the air temperature measured in the outlet temperature of the air handling unit.

In the installation example above, MIXIT is configured with:

- An outdoor temperature sensor, perfect for utilising the following features:
  - outdoor temperature compensation
  - warm-weather shutdown.
- An antifreeze sensor for the system to avoid ice building up in the air handling unit and frost damage. The sensor acts as extra protection, as MIXIT offers several antifreeze functions to protect the system:
  - A purge function which preheats the coil before activating the enable signal in relay 2. The signal can be used to open the dampers and let in air. Furthermore, an internal frost protection function can be set. Both functions are available when setting up MIXIT in Grundfos GO Remote. See [6.3 Coil preheat and frost protection](#).
  - MIXIT has a digital input, which can be connected to an external bimetalic temperature switch.
- An air temperature sensor placed in the outlet of the unit to ensure correct air temperature.

**Data**

MIXIT receives data on the mixed flow temperature from the pump's temperature sensor, while MIXIT itself measures:

- flow and temperature of the A port
- temperature of the B port.

These data can be used for the following features:

- temperature control
- pressure independence
- return temperature limit
- thermal power limit
- heat monitor.

## Ball valve

MIXIT leads hot water through port A and lets return water in through port B. The mixed water is then let out through the AB port.

Due to the unique design of the ball valve, MIXIT can be configured both as a two-way valve and a three-way valve. MIXIT does this by simply changing the opening direction of the ball valve.

### Two-way valve with a shunt

By turning the ball valve in a clockwise direction (I-II-III), port A goes from closed to fully open position and vice-versa in a counterclockwise direction (III-II-I). Port B is always fully open and works as a shunt.

### Three-way valve

By adjusting the angle of the ball valve in a counterclockwise direction (I-II-III), port A goes from closed to a fully open position, while port B goes from fully open to closed. The opposite happens when the ball valve is adjusted in a clockwise direction (III-II-I).

### Two- and three way operation

Top: two-way operation, bottom: three-way operation

## Non-return valve

Threaded versions of MIXIT are factory fitted with a non-return valve. For flange versions, non-return valves are available as accessories and are installed externally at the B-port of the MIXIT unit.

The non-return valve ensures that the liquid flows through the pipe in the correct direction where pressure conditions may otherwise cause a reversed flow.

Some systems require a non-return valve, while other systems might not need it. Therefore, the non-return valve can easily be removed to eliminate any unwanted resistance.

## Seats

The PTFE seats in MIXIT offer low friction and a high level of tightness. The EPDM O-rings located between the valve housing and seats in ports A and B create compression making the valve less sensitive to wear and tolerances.

## Sensors

The valve has integrated flow and temperature sensors. The Integrated Temperature sensor Standard (ITS2) measures the temperature at the B-port. The Vortex Flow sensor Standard (VFS) measures the flow at the A-port, which is used for the pressure independent functionality. Additionally, it measures the temperature at the A-port.

Due to these sensors, the high mechanical resolution of the control valve and the construction of the ball valve, it is possible for MIXIT to operate effectively with a lower pressure difference than traditional mechanical solutions.

When paired with a MAGNA3 pump, MIXIT is able to use all the MAGNA3 parameters.

## Vortex Flow sensor Standard (VFS)

The Vortex Flow sensor Standard (VFS) is a combined flow and temperature sensor (two-in-one) from Grundfos Direct Sensors™. The sensor is based on the principle of vortex shedding behind a bluff body. The VFS sensor is fully compatible with wet, aggressive liquids. The sensor is based on a Micro Electro-Mechanical System (MEMS) sensing technology in combination with the corrosion-resistant Silicoat® coating technology on the sensor chip.

## Integrated Temperature sensor Standard (ITS2)

The Integrated Temperature sensor Standard (ITS2) is a temperature sensor from Grundfos Direct Sensors™. The ITS2 sensor is fully compatible with wet, aggressive liquids. The sensor is based on a Micro Electro-Mechanical System (MEMS) sensing technology in combination with the corrosion resistant Silicoat® coating technology on the sensor chip.

## 6. Functions overview

All needed functions and controls of a mixing loop are built into MIXIT. Not only does this mean simple implementation and installation, but also an efficient, reliable and smooth operation.

		MIXIT valve unit	MIXIT DYNAMIC valve unit	DYNAMIC upgrade	CONNECT upgrade
Standard functions	Temperature controller	•	•		
	Underfloor overheat protection (for underfloor heating systems)	•	•		
	Coil preheat and frost protection (for air handling unit systems)	•	•		
	Pump control modes				
	• AUTO <sub>ADAPT</sub>				
	• Proportional pressure	•	•		
	• Constant pressure				
	• Constant flow				
	• Constant curve/constant speed				
Eco functions	Outdoor temperature compensation	•	•		
	Eco schedule and warm-weather shutdown	•	•		
	Pressure independence		•	•	
	Energy monitor		•	•

	• Supply flow limit				
	• Return temperature limit		•	•	
Monitoring and control	Grundfos BuildingConnect Free Monitoring	•	•	•	
	Grundfos BuildingConnect Professional				•
	Fieldbus integration (BACnet and Modbus)				•

The standard functions are always included. The DYNAMIC and CONNECT upgrades can be combined.

### MIXIT, valve unit variant

The functions in MIXIT are standard and are mainly suited for three-way installations in large buildings, such as schools, with no need for monitoring, pressure independence or balancing.

MIXIT gives access to Grundfos BuildingConnect Free Monitoring.

MIXIT can be upgraded with DYNAMIC and CONNECT.

### MIXIT DYNAMIC, valve unit variant

MIXIT DYNAMIC includes balancing limiters functions, pressure independence as well as the Free Monitoring version of Grundfos BuildingConnect. This valve unit is recommended for pressurised applications, where pressure independence, energy monitoring and flow or energy balancing are required.

MIXIT DYNAMIC can be upgraded with CONNECT.

### DYNAMIC upgrade

The DYNAMIC upgrade offers balancing limiters functions and pressure independence. Also, it gives access to the Grundfos BuildingConnect Free Monitoring solution.

The DYNAMIC and CONNECT upgrades can be combined.

### CONNECT upgrade

CONNECT is suitable when MIXIT operates as a subsystem in large installations where a BMS system is already in place. The upgrade enables you to connect MIXIT to a building management system via fieldbus (BACnet or Modbus) and gives access to Grundfos BuildingConnect Professional.

The DYNAMIC and CONNECT upgrades can be combined.

[MIXIT in an air handling unit system](#)

## Temperature controller

From factory MIXIT is configured so that the temperature response of the system in most cases corresponds to the centre graph in the figure. This is the ideal response, however, in some cases it may be necessary to adjust it.

TM077581

*Typical responses to a step input for PI controlled systems such as MIXIT*

By increasing the proportional gain ( $K_p$ ) of the controller, as shown in the top row in the figure, the response rises more rapidly. If the gain is too high, undamped oscillations occur. If the gain is even higher, the oscillation of the temperature will continue, causing instability. By decreasing the proportional gain of the controller, as shown in the bottom row in the figure, the response becomes slower.

By increasing the integral time ( $T_i$ ), as shown in the right column in the figure, the response takes longer time to reach the setpoint. Decreasing the integral time has the opposite effect, which is shown in the left column in the figure.

## Underfloor overheat protection

When selecting the application type **Underfloor heating**, you can choose to activate the floor overheat protection function.

By defining a maximum forward flow temperature, you ensure that the temperature will never exceed the given value, thus protecting the floor from overheating.

## Coil preheat and frost protection

When choosing the application type **Heating coil**, you can activate the coil preheat and frost protection functions.

### Coil preheat

With MIXIT you can preheat the coil before allowing the fan to start.

In Grundfos GO Remote you define a return temperature threshold to indicate when the coil is heated. By preheating the coil a higher level of comfort is ensured which also minimises the risk of frost in the coil.

### Frost protection

You can protect the coil from freezing by defining an air and return flow temperature. If the temperature falls below one of the two temperature limits, MIXIT will react by fully opening the valve in order to circulate hot water in the system.

The return flow temperature is measured by the sensor in port B of MIXIT. To measure the air temperature, you will need to install a temperature sensor in the coil.

## Pump control modes

When MIXIT is connected to the pump, the control mode is by default set to the control mode that best suits the application in which MIXIT operates. You can choose between five different control modes:

- **AUTO<sub>ADAPT</sub>**  
During operation, the pump automatically makes the necessary adjustment to the actual system characteristic. Recommended for most heating systems.
- **Proportional pressure**  
Default control mode for radiator heating systems. Typically used in systems with relatively large pressure losses in the distribution pipes.
- **Constant pressure**  
Default control mode for underfloor heating systems. We recommend this control mode in systems with relatively small pressure losses such as underfloor heating systems.
- **Constant curve/constant speed**  
Default control mode for air handling units. The pump operates according to a constant curve and is suitable for systems where both a constant flow rate and a constant head are required.
- **Constant flow**  
The pump maintains a constant flow in the system independently of the head. We recommend that you use this control mode in air handling unit systems.

## Outdoor temperature compensation

With the outdoor temperature compensation function activated, the product automatically adjusts the mixed flow temperature according to the outdoor temperature.

Outdoor temperature compensation is set by means of a five-point temperature curve. The curve allows you to predefine five liquid temperature setpoints. MIXIT interpolates between the setpoints and automatically adjusts the liquid temperature accordingly to compensate for the heat demand.

For heating-coil applications, the curve defines the air temperature.

TM072831

*Example of five point temperature curve. Y axis: Setpoint [°C]. X axis: Outdoor temperature [°C].*

## Eco schedule

In some applications it can be useful to predefine a start and stop schedule and apply an automatic temperature setback function in order to minimise consumption, and thereby energy costs.

With the Eco schedule you can configure start and stop intervals on a weekly basis as well as set single events.

### Temperature setback and system turn off

A temperature setback can be defined for the period in which MIXIT runs on Eco schedule. In this period, MIXIT sets the normal operation temperature back with the number of degrees set in Grundfos GO Remote.

MIXIT can also be set to turn off during the Eco period.

## Warm-weather shutdown

When a defined maximum outdoor temperature has been surpassed one to three days in a row, MIXIT automatically shuts down and the pump stops. MIXIT and the pump start again when the average outdoor temperature falls below the temperature limit one to three days in a row, depending on the defined settings.

The temperature and number of days are set in Grundfos GO Remote.

The temperature signal must be available from either an outdoor temperature sensor or fieldbus.

Once the function has been activated or the function settings have been changed, MIXIT will immediately act accordingly.

## Pressure independence

If the differential pressure varies on the primary side, the flow through the valve changes causing poor control performance and fluctuating temperature.

By measuring the flow on the primary side, MIXIT is able to regulate the valve position accordingly. This means that MIXIT maintains a constant flow even though the differential pressure on the primary side changes. This allows the system to perform optimally, increasing both comfort and energy efficiency.

## Supply flow limit

To ensure enough primary flow to all installed MIXIT systems, you can balance each system according to their heat demand. This is done by limiting the primary flow through the valve.

As illustrated below, the primary flow of the valve ( $Q_{\max}$ ) is adjusted to the maximum flow of the system (1). Hereby a new working range (2) is set for the valve. The working range is configured during setup without any mechanical adjustments.

TM072799

Pos.	Description
1	Balanced maximum flow, system
2	New working range for valve

The valve is adjustable within its flow range ( $K_{vs}$  value). The table in [2. Performance range](#) shows the flow ranges and  $K_{vs}$  values for each MIXIT variant.

If the CONNECT upgrade is installed, the primary flow data can be provided to a building automation system for monitoring purposes.

### Related information

[2. Performance range](#)

## Return temperature limit

Return temperature limit is commonly used to keep a high efficiency at the heat source and to protect the production plant.

The integrated temperature sensor in MIXIT monitors the return temperature. By using the return temperature limit function, you are able to keep the temperature below a set limit.

## Thermal power limit

MIXIT can be configured to limit the thermal power delivered by the mixing loop. The power limiter automatically limits the valve opening whenever the configured power limit is exceeded.

## Differential temperature limit

MIXIT can be configured to limit the temperature difference between the primary supply and return flow. This is especially useful in district heating where the payment tariff can depend on the differential temperature.

## Energy monitor

With the energy monitor function it is possible to monitor the energy consumption in individual zones. This function does not require any additional sensors or any additional settings to the system.

The calculated value cannot be used for billing purposes. However, it is perfect for optimisation purposes in order to prevent excessive energy costs caused by system imbalances.

## Grundfos BuildingConnect

With Grundfos BuildingConnect you can monitor your MIXIT system from the office or on the go. Grundfos BuildingConnect offers realtime monitoring, including alarm and warning notifications.

With Grundfos BuildingConnect Professional you get access to even more monitoring points as well as the ability to control the system.

## Fieldbus integration

The integrated fieldbus makes it easy to incorporate MIXIT into any building management system (BMS).

MIXIT provides all data points through one data connection because the valve, pump, controller and sensors are one complete system. No I/O is required in the sub controller, and if the integrator uses an IP-based fieldbus, the sub controller is redundant.

Furthermore, the integrated fieldbus offers:

- A cost-effective installation due to less wiring
- Up to 170 data points delivering all available objects from MAGNA3 and MIXIT
- Performance/response tests offsite
- Offsite balancing and optimisation without having to manually change valve positions
- Logging of parameters such as:
  - supply temperature, mixed temperature and return temperature
  - flow estimation
  - valve position
  - power estimations
  - warnings and alarms.

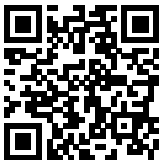

The integration can be done via BACnet IP, BACnet MS/TP, Modbus TCP or Modbus RTU. The connectivity is configured via the Grundfos GO Remote app. When the fieldbus connection is established, the remaining configuration can be done via the bus system setup.

### Built-in line termination

If MIXIT is the last device on the fieldbus cable, a built-in terminal resistor can be activated via an on/off switch to avoid noise on the cable. Note that this only applies to BACnet MS/TP and Modbus RTU connections.

### Functional profiles

There are two functional profiles available for MIXIT covering all four fieldbus connections. The documents are available via Grundfos Product Center, <http://product-selection.grundfos.com>, or by scanning the QR codes listed below.

Document	Product number	QR code	
BACnet IP and BACnet MS/TP	99258495		QR99258495
Modbus TCP and Modbus RTU	99349159		QR99349159

## 7. Installation

MIXIT allows you to build a complete mixing loop in only two steps.

### 1. Install MIXIT and the pump in the pipe system.

You must install MIXIT and the pump in such a way that they are not stressed by the pipes. The two units may be suspended directly in the pipes, provided that the pipes can support them.

To ensure sufficient cooling of motor and electronics, observe the following:

- Position MIXIT and the pump in such a way that sufficient cooling is ensured.
- The ambient temperature must not exceed 50 °C.

### 2. Connect MIXIT and the pump to the power supply. Once connected, the installation of MIXIT is complete.

## Insulating shells

In heating systems the insulating shells supplied with MIXIT must be fitted as part of the installation to reduce the heat loss.

## Electrical installation

All electrical connections must be carried out by a qualified electrician in accordance with local regulations.

- The system must be connected to an external main switch.
- The system must always be correctly earthed.
- The system requires no external motor protection.
- The system incorporates thermal protection in order to prevent slow overloading and blocking.

MIXIT has a digital input that can be used for external control of start/stop of both the pump and MIXIT without switching the power supply on/off. We do not recommend that the pump is started and stopped on its own without MIXIT being started and stopped as well.

### Related information

[Cable requirements](#)

## Orientations

MIXIT can be installed both horizontally and vertically. Normally, MIXIT and the pump will be mounted in line.

## 8. Operating the product

### Operating panel for MIXIT

TM071469

Pos.	Description	
1	Connect button for connecting the valve unit with the pump and connecting MIXIT with Grundfos GO Remote.	When MIXIT tries to establish contact with either the pump or Grundfos GO Remote, the blue LED flashes. Once connection is established, the LED is permanently on.
2	Locked operating panel	This indicates that the operating panel is locked. The panel can be locked and unlocked using Grundfos GO Remote.
3	Temperature indication (setpoint, inlet or return temperature) <b>Default mode:</b> None of the three LEDs are lit and the temperature shown is the mixed flow temperature.	Indicates which temperature is shown in the display (7). Press the <b>OK</b> button to toggle between the following: <ul style="list-style-type: none"> <li>• <b>SET:</b> Setpoint. Shows the current setpoint. Indicates that the setpoint is being or can be adjusted. To adjust the setpoint use the two arrow buttons.</li> <li>• <b>Arrow pointing right:</b> Supply temperature. Lights red in heating systems, blue in cooling systems.</li> <li>• <b>Arrow pointing left:</b> Return temperature. Lights blue in heating systems, red in cooling systems.</li> </ul> The display returns to its default mode after 12 seconds.
4	AB port orientation	This indicates the orientation of the AB port (flow outlet).
5	Valve position	This indicates to which degree the valve is open. <b>0</b> means that the valve is closed. <b>Max.</b> means that the valve is fully open. If a flow limit is configured, this limit will be <b>Max.</b>
6	Warning and alarm indication	Yellow indicates a warning. The system continues to operate. Red indicates an alarm. The system stops operating.
7	Temperature/fault code <b>Default mode:</b> Mixed flow temperature.	The display shows: <ul style="list-style-type: none"> <li>• Temperature setpoint. To adjust the setpoint use the <b>Up</b> and <b>Down</b> buttons.</li> <li>• Inlet, outlet or mixed flow temperature (see 3).</li> <li>• Fault codes.</li> </ul>
8	External control	This indicates that MIXIT is being controlled by external communication equipment.

**Note:** Once the pump and MIXIT are connected, MIXIT takes over and controls the pump. From then on the pump's operating panel is locked. Settings to the system are done via Grundfos GO Remote and the operating panel of MIXIT.

#### Related information

[Starting up the system](#)

## Starting up the system

Once powered up, the pump and the MIXIT unit can be started. Starting up the product is done in four simple steps.

### Step 1

#### Set AB port orientation

Use the **Up** and **Down** buttons on the MIXIT operating panel to set the AB port flow orientation and press **OK**.

TM071477

### Step 2

#### Configure the pump

Set the pump by completing the startup wizard.

TM071475

### Step 3

#### Connect the pump and the MIXIT unit

By pressing the connectivity button on the MIXIT operating panel (1), MIXIT tries to establish contact with the pump (2). Confirm by pressing the **OK** button on the pump (3). The pump's display turns off after approximately 20 minutes (4).

TM071476

### Step 4

#### Set temperature setpoint

Use the **Up** and **Down** buttons on the MIXIT operating panel to adjust the desired temperature setpoint. Press **OK** to complete the setup.

TM071478

For detailed instructions on setting up the product, see separate installation and operating instructions.

### Related information

[Operating panel for MIXIT](#)

## Temporary heating

In new buildings MIXIT can be used for dehumidification, as MIXIT is ready to operate after the initial startup of the system.

This means that you can dry out excess water content from building materials while construction work continues. When ready, any additional wiring and the remaining setup is completed via Grundfos GO Remote.

## Setting up the product using Grundfos GO Remote

Once the initial start up of the MIXIT unit and pump is completed, MIXIT is connected with the Grundfos GO Remote app via Bluetooth.

Once connected, a wizard helps you set up your MIXIT system. The wizard lets you:

- turn on temporary heating
- define the application and circuit type
- choose whether MIXIT must operate as a two- or three-way valve
- set the pump's control mode, head and flow duty point
- define sensor inputs.

Once the setup wizard is completed, the functionalities available according to your chosen upgrade can be set. MIXIT can at all times be upgraded by downloading another upgrade via Grundfos GO Remote.

### Monitoring MIXIT

Grundfos GO Remote allows you to monitor the system live, including:

- inputs from sensors
- mixed flow temperature and return temperature
- pump status
- valve status.

### Fieldbus connection

If MIXIT is integrated into a building management system, the connectivity is configured via Grundfos GO Remote. When the fieldbus connection is established, the remaining configuration can be done via the bus system setup.

Fieldbus connection requires that the CONNECT upgrade has been activated.

TM071468

Connecting MIXIT with Grundfos GO Remote

### Related information

[Fieldbus integration](#)

## Warnings and alarms

If MIXIT detects a warning or an alarm, it will be highlighted on its operating panel via the yellow (warning) and red (alarm) LED. See [8.1 Operating panel for MIXIT](#). The operating panel uses the LEDs of the temperature setpoint to show the error code.

The **Alarms and warnings** menu in Grundfos GO Remote describes the fault and lets you reset it when it has been corrected. This menu also keeps a log of previous warnings and alarms.

## Firmware updates

MIXIT firmware is updated via Grundfos GO Remote.

If online and connected to MIXIT, the app automatically notifies the user about available updates. To update the firmware, simply follow the instructions in Grundfos GO Remote.

## 9. Operating conditions

### Location

The product is designed for indoor installation.

Always install the product in a dry environment where it will not be exposed to drops or splashes, for example water, from surrounding equipment or structures. As the product contains stainless-steel parts, it is important that it is not installed directly in environments, such as:

- Indoor swimming pools where the product would be exposed to the ambient environment of the pool.
- Locations with direct and continuous exposure to a marine atmosphere.
- In rooms where hydrochloric acid (HCl) can form acidic aerosols escaping from, for example, open tanks or frequently opened or vented containers.

The above applications do not disqualify for installation of the product. However, it is important that the product is not installed directly in these environments.

### Maximum distance between MIXIT and the pump

We recommend a maximum distance of 0.5 m between MIXIT and the pump to ensure optimal performance at low load.

### Minimum space requirements

MIXIT requires the following space on the installation site.

	Clearance [mm]
Top and bottom	200
Left and right	100
Front and rear	100

TM075945

### Ambient conditions

Ambient temperature during operation	0-50 °C
Ambient temperature during storage and transport	-40 to +70 °C
Relative humidity	Maximum 95 %

### Maximum operating pressure

PN 6/10	6/10 bar / 0.6/1.0 MPa
PN 10	10 bar / 1.0 MPa

During normal operation, MIXIT must not be used at higher pressures than those indicated on the MIXIT's nameplate.

### Pumped liquids

The product is suitable for mixing clean, thin, non-aggressive and non-explosive liquids without solid particles or fibres.

The liquid must not be freezing or boiling.

The liquid temperature must be between 0 and 90 °C, not freezing or boiling. For short periods the temperature can be up to 110 °C provided that the media is being liquid and not boiling.

You can use the product for water, water-glycol-mixtures with up to 50 % glycol or water-ethylene-mixtures with up to 50 % ethylene. No matter which is used, it is important that it is in a liquid state. Freezing or boiling of the media must be prevented.

For the flow measurement to function effectively and precise at all flows, the viscosity must be equal to or below 2 cSt.

In heating systems, the water must meet the requirements of the accepted standard on water quality in heating systems according to local regulations.

The product is not intended for drinking water.

### Radio communication

The radios of this product are placed in unlicensed bands and can be used without restrictions anywhere in the EU member states.

The MIXIT unit has two radio signals; GLoWPAN and Bluetooth.

The Grundfos proprietary wireless signal GLoWPAN is used for communication between MIXIT and the pump, while the Bluetooth Low Energy (BLE) radio is used for communication between MIXIT and Grundfos GO Remote.

## 10. Technical data

### Type key

Example: MIXIT DYNAMIC 32 16 L NRV

Code	Designation	Explanation
MIXIT	Type range	MIXIT valve unit variant
[ ] DYNAMIC	Valve unit variant	[ ] : Standard functionalities included DYNAMIC: Standard and DYNAMIC upgrade functionalities included.
25 32 40 50	Nominal diameter (DN) of inlet and outlet ports [mm]	
6.3 10 16 25 40	K <sub>vs</sub> value	
L R	B port orientation	L: Left R: Right
[ ] F	Pipe connection type	[ ] : Thread F: Flange
[ ] NRV	Hydraulic accessories	[ ] : No non-return valve NRV: Non-return valve

## Cable requirements

Cable type: H05RN-F / H07RN-F

All control terminals are supplied by safety extra-low voltage (SELV) and separated.

All cables used must be heat-resistant up to at least 75 °C.

All cables used must be installed in accordance with EN 60204-1 and EN 50174-2:2000.

Use cable clamps and double insulated cables for relays.

Terminal	Cable	Cable cross section [mm <sup>2</sup> ]	Torque [Nm]
I/O terminals	Screened cable	0.5 - 1.5	0.2
AC supply	Cable	0.75 - 1.5	
RS-485	Screened 3-core cable		0.5
Relay 1 and 2	Screened cable	0.5 - 2.5	

Cable length		
Speed [Mbit/s]	Cable type	Max. cable length [m / ft]
10	CAT5	100 / 328
100	CAT5e	100 / 328

## Electrical data

All specified voltages refer to GND. GND is internally connected to protective earth.

Supply voltage	1 x 230 V - ± 10 %, 50 Hz, PE
Protective class	I
Insulation class	-
Maximum power	15 W
Rated impulse-withstand voltage	4kV
Short-circuit current rating	500 A
Overvoltage category (OVC)	III
Pollution degree	2

## Inputs and outputs

### Absolute maximum voltage and current limits

Relay 1 and 2, maximum contact load	250 VAC or 30 VDC, 2 A
RS-485 terminal	-5.5 to +9.0 VDC, else < 25 mADC
Other I/O terminals	-0.5 to +26 VDC, else < 15 mADC

Exceeding the electrical limits may result in severely reduced operating reliability and product life.

### Digital input (DI)

Internal pull-up current	> 10 mA at $V_i = 0$ V, $R_i = 100$ k $\Omega$ at $V_i > 5$ V
Certain low logic level	$V_i < 1.8$ V
Certain high logic level	$V_i > 2.7$ V or floating
Hysteresis	Yes

The I/Os, CIO and DI, are 24 V tolerant.

**Relay outputs**

Potential-free changeover contacts (SPDT)	
Contact ratings	250 VAC, 2 A, 50/60 Hz, AC-1 (resistive)
Action type	1.B (micro disconnection)
Minimum contact load when in use	5 VDC, 10 mA

**Analog input (AI)**

Voltage mode range	0-10 V
Voltage mode	R <sub>i</sub> = 100 kΩ
Current mode range	4-20 mA
Current mode	V <sub>in</sub> (appr.) = I <sub>in</sub> * 50 Ω + 1 V
Current mode overload protection	Yes, current limit > 75 mA
Measurement tolerance	± 3 % of full scale

**Analog output (AO)**

Sourcing capability only	
Voltage mode range	0-10 V
Min. load between AO and GND	3 kΩ
Short-circuit protection	Yes
Current mode range	4-20 mA
Voltage drive capability	10 V at 20 mA
Open-circuit protection	Yes
Tolerance	± 5 % of set value

**Pt1000 input (PT)**

Temperature measurement range	-30 to +180 °C
Measurement tolerance	± 1.5 °C
Measurement resolution	0.15 °C

**Power supplies (24 V)**

Output voltage	-24 VDC ± 5%
Max. current	100 mADC (sourcing only)
Overload protection	Yes

**Bus input (RS-485)**

Protocols	GENIbus, BACnet MS/TP, Modbus RTU, RS-485
Supply voltage	5 VDC ± 5 %, I <sub>max.</sub> 350mA

**Bus input (Ethernet)**

Protocols	BACnet IP, Modbus TCP
Cable type, BACnet IP	Standard CAT5, CAT5e or CAT6
Cable type, Modbus TCP	Standard CAT5, CAT5e or CAT6

**Classes**

Temperature class	TF110 (EN 60335-2-51)
Enclosure class	X4D (EN 60529)

## Sound pressure level

The sound pressure level for MIXIT without cavitation is below 40 dB(A).

## Actuator

Ball valve, movement and type of action	Angular rotation, 360° both ways Multiposition
Temperature for ball pressure test	125 °C
Maximum rated mechanical load	15 Nm
Travel time	1 minute
Limitation of operating time	1 second on / 4 seconds off

Sensor data

Vortex flow sensor, port A	From 0.3 m³/h depending on the MIXIT variant with a dynamic range of 1:25.
Temperature range, port A and port B	-10 to +120 °C
Accuracy temperature, port A and port B	± 1.25 °C (-10 to +80 °C), ± 1.3 °C (80-90 °C), ± 2 °C (90-110 °C) Flow ratio, Qab/Qa: 1.1-10.

Flow sensor accuracy

The curves show how accurate the flow sensor measures the actual flow.

TM074191

TM074192

TM074193

## Valve

### Valve details

Type of valve	Mixing valve
Function	Three-way inverting valve or two-way modulating valve with integrated shunt
Type of closure member	Ball
Type of operation	Directly controlled and operated, no minimum differential pressure
Type of movement	Rotational, no mechanical stops
Positioning	Modulating
Valve stroke (rated travel)	90°
Position when de-energised	N/A, no fail-safe
Leakage	Port A: max. $5 \cdot 10^{-6} \cdot K_{vs}$ (according to EN 60534-4, class IV-S1) Port B: max. $10^{-3} \cdot K_{vs}$ (according to EN 60534-4, class III)

### Connections (Threaded version)

Number of ports	3
Type of end-connection	Externally threaded, ISO 228-1
Inner dimension of ports	DN size
Dimension of end-connection threads	DN 25 - G 1 1/2, DN 32 - G 2

### Connections (Flanged version)

Number of ports	3
Type of end-connection	Flange connection, EN 1092-2
Inner dimension of ports	DN size
Dimension of end - pipe connection	DN 32, DN 40, DN 50

### Size and capacity

DN size	Capacity [ $K_{vs}$ ]
DN 25-6.3	6.3
DN 25-10	10
DN 32-16	16
DN 32-16 L F	16
DN 32-16 R F	16
DN 40-25 L F	25
DN 40-25 R F	25
DN 50-40 L F	40
DN 50-40 R F	40

### Media and working conditions

Minimum temperature	0 °C, non-freezing
Maximum temperature	90 °C
Maximum temperature, short term	110 °C, non-boiling
Minimum differential pressure	0 bar
Maximum differential pressure for normal operation and close-off	2.5 bar
Maximum differential pressure for positioning	5 bar
Maximum differential pressure, not for normal operation	10 bar
Maximum rated working pressure (PS)	10 bar
Liquid types	Water Water-glycol-mixtures with up to 50 % glycol Water-ethylene-mixtures with up to 50 % ethylene
Not suitable for drinking water.	

### Wetted materials

Valve housing	Cast iron GJS500-7, CED coated
O-rings	EPDM (EP70)
Seats	Carbon reinforced PTFE
Ball	Brass CW314N, Ni and Cr plated

Other metal parts	Stainless steel
Friction discs	PTFE
Other plastic parts	PPS 40-GF
Non-return valve (Threaded versions only)	PPO, EPDM, stainless steel
Sensors	PPS, EPDM, corrosion-resistant coating

Cavitation risk

Cavitation risk in a system with a liquid temperature of 20 °C. Y axis: Differential pressure [bar]. X axis: Static pressure, relative [bar].

Coloured area	Description
Green	No or very low risk of cavitation
Yellow	Risk of cavitation
Light red	Cavitation
Dark red	The differential pressure must not exceed 2.5 bar.

As a rule of thumb, the relative static pressure must be at least 3 times the differential pressure across any valve in the system. According to the figure above, cavitation is present in the light red area, while the dark red area is out of specification. Stay clear of the red areas and carefully consider avoiding the yellow area. The risk of cavitation increases with the temperature, and thus the static pressure must be adjusted accordingly.

TM073275

## Valve characteristics

TM077383

*Inherent flow characteristic for A-AB in modified equal percentage. X axis: Relative travel,  $h$ . Y axis: Relative flow coefficient,  $\Phi$ .*

Inherent flow characteristic A-AB	Modified equal percentage (tested according to EN 60534-2-4 and VDI/VDE 2173)
Inherent flow characteristic B-AB, three-way function	Modified equal percentage (tested according to EN 60534-2-4 and VDI/VDE 2173)
Inherent flow characteristic B-AB, two-way function	Fully open
Inherent rangeability A-AB	>150 (tested according to EN 60534-2-4 and VDI/VDE 2173)

## 12. Accessories

### Insulating shells for air-conditioning and cooling systems

If the product is to be used in air-conditioning and cooling systems you can fit it with insulating shells.

Insulating shells	Product number
DN 25	Contact Grundfos
DN 32	Contact Grundfos
DN 40	Contact Grundfos
DN 50	Contact Grundfos

### Insulating shells for heating systems

Insulating shells for heating systems are supplied with the product, but can also be ordered as an accessory.

Insulating shells for airconditioning and cooling systems can also be ordered as an accessory.

Insulating shells	Product number
DN 25	Contact Grundfos
DN 32	Contact Grundfos
DN 40	Contact Grundfos
DN 50	Contact Grundfos

### Non-return valve

Threaded versions of MIXIT, DN 25-32, are fitted with a non-return valve from factory. For flange versions, DN 32-50, non-return valves are available as accessories and are mounted externally at the B-port of the valve.

Non-return valve for flange versions	Product number
DN 32	Contact Grundfos
DN 40	Contact Grundfos
DN 50	Contact Grundfos

### Outdoor temperature sensors

An outdoor temperature sensor can be fitted to make use of the **Outdoor temperature compensation** and **Warm-weather shutdown** functionalities, in which MIXIT automatically adjusts the mixed flow temperature to the actual temperature outside.

The ESMT sensor is used for single MIXIT systems, while the DOL 114 RH/T sensor is suitable if the signal is to be shared between several MIXIT units.

TM072916

Left to right: ESMT and DOL 114 RH/T sensor

Sensor	Type	Supplier	Measuring range [°C]	Output signal	Product number
Outdoor temperature sensor	ESMT	Danfoss	-30 °C to 50 °C	Pt1000	99113175
Outdoor temperature sensor	DOL 114 RH/T	Dol Sensors	-40 °C to 60 °C	0 - 10 V	99113183

### Radiation shield

A radiation shield is available for the DOL 114 sensor. The shield protects the sensor from rain and radiated heat.

Product	Supplier	Product number
Radiation shield for DOL 114	Dol Sensors	99113181

## Temperature sensors

TM072917

### ESM-11 sensor

Sensor	Type	Supplier	Measuring range [°C]	Output signal	Product number
Temperature sensor, outside pipe	ESM-11	Danfoss	0 °C to 100 °C	Pt1000	99113176

## Temperature protection switch

To provide a thermal protection in the system, a temperature protection switch can be installed. Once the temperature of 50 °C is reached, the temperature switch activates the input terminal of the MIXIT unit causing the valve to close.

Product	Supplier	Switching temperature	Product number
Temperature switch	JUMO	50 °C	99113180

## 13. Product numbers

When ordering a complete MIXIT system, you are required to choose:

- A MIXIT valve unit, either the MIXIT or MIXIT DYNAMIC variant
- A MAGNA3 pump  
The MIXIT valve units are applicable with the MAGNA3 pumps as stated in the table in [2. Performance range](#).
- Optional: A DYNAMIC or CONNECT upgrade when wanting to acquire more functionalities.

## 14. Technical terms

Actuator	An actuator controls the opening of a valve via a control signal. MIXIT has a build in actuator in its control box.
A port	Port on the MIXIT unit.
AB port	Port on the MIXIT unit. The mixed liquid from the A and B port is led out through the AB port.
BACnet	BACnet is a communications protocol for building, automation and controls network. The protocol governs how devices across building automation systems work together.
Ball valve	A hollow ball, which is used to control the flow through it. The ball valve in MIXIT can be configured both as a two-way valve and a three-way valve. MIXIT changes between the two simply by changing the opening direction of the ball valve.
Bluff body	When a bluff body is placed inside a pipe, a series of vortices will be generated on either side of the bluff body. These vortices propagate downstream, giving rise to periodic pressure variations which can be detected by the flow sensor. The frequency of the pressure variations is proportional to the volume flow through the pipe.
B port	Port on the MIXIT unit. The return liquid from the system is led back into the loop via the B port.
B-port orientation	The B port on a MIXIT unit will either be on the left or right side of the valve.
Building Management System (BMS)	A Building Management System (BMS) is a control system that controls and monitors a building's systems such as heating and ventilation. A BMS typically uses protocols such as BACnet and Modbus.
Controller	Using sensor inputs a controller holds the liquid temperature at a specified temperature setpoint. In MIXIT the controller is integrated.
Delta T ( $\Delta T$ )	Delta T ( $\Delta T$ ) is the temperature difference between the supply and return liquid in a heating or cooling system.
Fieldbus	Fieldbus is a two-way communication link between devices. Fieldbus is integrated into the MIXIT unit and act as the link between MIXIT and a Building Management System. MIXIT provides all data points through one data connection and no I/O is required in the sub controller. If the integrator uses an IP-based fieldbus, the sub controller is redundant.
Firmware	Firmware is software integrated in a hardware device. The firmware is specifically designed for that piece of hardware and acts as the operating system.
Flow	Flow is the amount of liquid that passes through a pump within a certain period of time. Volume flow (Q) is the amount of liquid, the pump can move per unit time ( $m^3/h$ ).
Flow temperature	The temperature of the liquid in the supply pipe in a heating or cooling system.
GENIbus	GENIbus is an open data communication protocol developed and maintained by Grundfos. It is used to connect Grundfos pumps to pump controllers or via gateways to monitoring and supervisory computers in Building Management Systems and SCADA systems.
GLoWPAN	GLoWPAN is a propriety wireless signal developed and maintained by Grundfos.
Heat load, $\Phi$ [kW]	The amount of heat required by a heating system.
Hydraulic power	The power that the pump transfers to the liquid in the shape of flow and head.
Injection circuit, two-way valve	This injection circuit operates with a variable flow on the primary side and a constant flow on the secondary side. The circuit has a pump installed on the primary side, injecting the liquid into the heating system, while the pump on the secondary side distributes the liquid in the system.
Injection circuit, three-way valve	The injection circuit operates with a constant flow and temperature on the primary side, causing the temperature on the secondary side to increase instantly. The circuit has a pump installed on the primary side, injecting the liquid into the heating system, while the pump on the secondary side distributes the liquid in the system. In a two-way valve injection circuit, the temperature at the mixing point is controlled by opening and closing the valve. In a three-way valve injection circuit, the mixed temperature is controlled by opening and closing port A of the control valve.
$K_v$	$K_v$ represents the valve capacity measured as the flow of liquid in $m^3/h$ at a pressure differential of 1 bar across the valve, with the valve open at any position.
$K_{vs}$	$K_{vs}$ is the maximum $K_v$ value measured when the valve is fully open (100 %). For MIXIT, the $K_{vs}$ value represent the water in $m^3/h$ at a differential pressure of 1 bar from port A to AB. The $K_{vs}$ value can be used to determine the size of a valve.
Mixing circuit	The basic principle of a mixing loop is to mix the primary liquid with the return liquid to obtain the required mix temperature. The mixing circuit operates with a variable flow on the primary side and a constant flow on the secondary side. Because the system in this type of application allows for variable flow, there is no primary pump.
Modbus	Modbus is a communications protocol enabling communication between devices connected to the same network.
Non-return valve	The non-return valve ensures that the liquid flows through the pipe in the correct direction where pressure conditions may otherwise cause a reversed flow.
Integrated Temperature Sensor (ITS)	A temperature sensor integrated in the MIXIT unit.
Secondary flow	The secondary flow refers to the flow in the secondary circuit of a heating or cooling system.

Secondary temperature difference	The temperature difference between the supply and return liquid in the secondary circuit of a heating or cooling system.
Settable flow range	The products working range within which a maximum flow can be set.
Valve position	LEDs on MIXIT's operating panel, indicating to what degree the valve is open.
Vortex flow sensor	A combined flow and temperature sensor integrated in the MIXIT unit.

## 15. Grundfos Product Center

Online search and sizing tool to help you make the right choice.

From the international view, you can select your specific country to view the product range available to you.

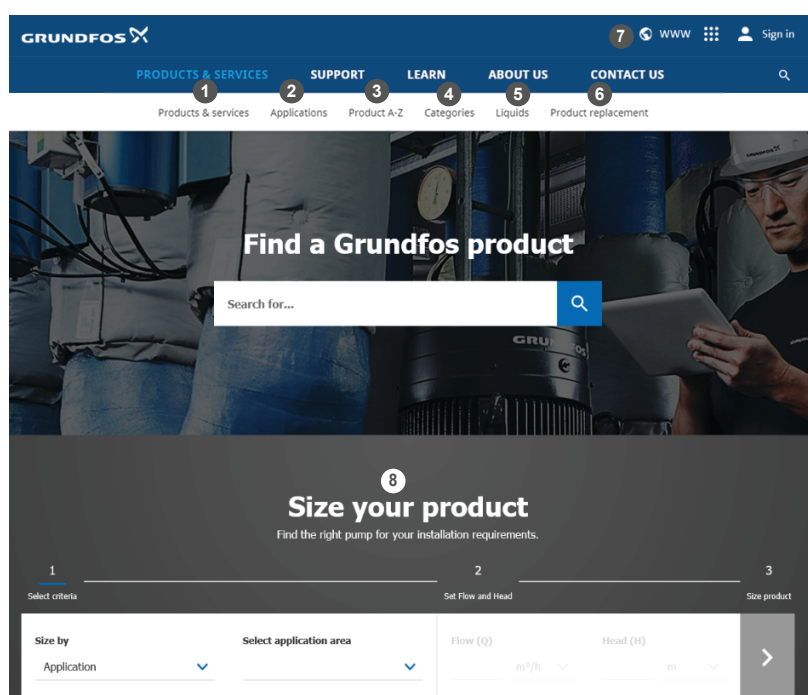

International view: <http://product-selection.grundfos.com>

### All the information you need in one place

Performance curves, technical specifications, pictures, dimensional drawings, motor curves, wiring diagrams, spare parts, service kits, 3D drawings, documents, system parts. The Product Center displays any recent and saved items - including complete projects - right on the main page.

### Downloads

On the product pages, you can download installation and operating instructions, data booklets, service instructions, etc., in PDF format.

When you select your country, you will see the menus below. Note that some menus may not be available depending on the country.

Example: <https://product-selection.grundfos.com/uk>

Pos.	Description
1	<b>Products &amp; services</b> enables you to find products and documents by typing a product number or name into the search field.
2	<b>Applications</b> enables you to choose an application to see how Grundfos can help you design and optimise your system.
3	<b>Products A-Z</b> enables you to look through a list of all the Grundfos products.
4	<b>Categories</b> enables you to look for a product category.
5	<b>Liquids</b> enables you to find pumps designed for aggressive, flammable or other special liquids.
6	<b>Product replacement</b> enables you to find a suitable replacement.
7	<b>WWW</b> enables you to select the country, which changes the language, the available product range and the structure of the website.
8	<b>Sizing</b> enables you to size a product based on your application and operating conditions.
