## Manufacturing site(s)

The environmental product declaration is for 1 kg of Sika MonoTop®-4012 produced by Sika Österreich GmbH at following manufacturing facilities:

Sika Österreich GmbH  
Bingser Dorfstraße 23  
Postfach 168  
6700 Bludenz  
Austria

## Construction Product

### Product Description

Sika MonoTop®-4012 is a 1-part, cementitious, fibre reinforced, low shrinkage repair mortar. It contains recycled materials (supplementary cementitious materials). Sika MonoTop®-4012 can be applied in layers with thickness between 6 and 120 mm, with a fresh density of 2.1 kg/L.

### Technical Information

| Property                                  | Value, Unit                                  |
|---|--|
| Compressive strength after 28 days        | ~56 MPa                                      |
| Modulus of elasticity in compression      | ≥ 20 GPa                                     |
| Tensile strength in flexure after 28 days | ~ 8 MPa                                      |
| Tensile Adhesion Strength                 | ≥ 2 MPa                                      |
| Shrinkage after 28 days                   | ~500 µm/m                                    |
| Restrained shrinkage/ Expansion           | ≥ 2 MPa                                      |
| Thermal compatibility, part 1 Freeze-Thaw | ≥ 2 MPa                                      |
| Coefficient of Thermal expansion          | ~16 x 10 <sup>-6</sup> 1/k                   |
| Reaction to fire                          | Euro class A1                                |
| Capillary absorption                      | ≤ 0.5 kg/(m <sup>2</sup> .h <sup>0.5</sup> ) |
| Chloride ion diffusion resistance         | Low, <2000 Coulombs                          |

| Property               | Value, Unit                           |
|------------------------|---------------------------------------|
| Carbonation resistance | $dk \leq$ control concrete MC (0.45)  |
| Electrical resistivity | $< 100 \text{ k}\Omega\cdot\text{cm}$ |

Further information about the product including product data sheet can be accessed via [www.sika.com](http://www.sika.com)

### Main Product Contents

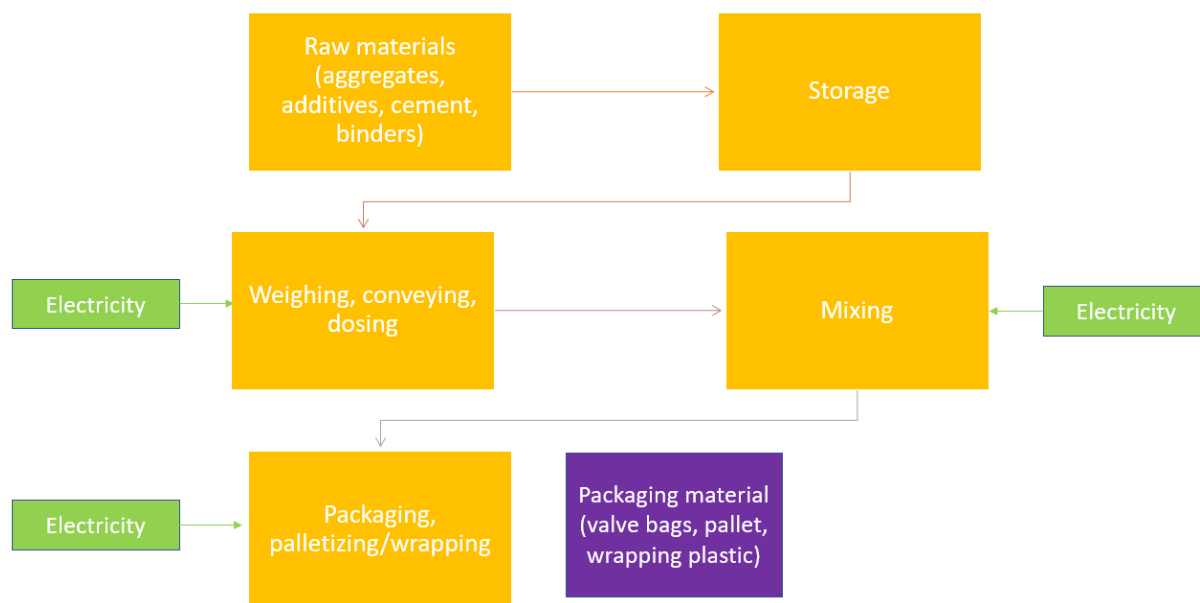

| Material/Chemical Input                                    | %       |
|--|---------|
| Hydraulic Binders  | 20 - 25 |
| Functional Fillers   | 60 - 70 |
| Supplementary cementitious material (SCM) Reactive Binders | 10 – 15 |
| Polymers and Additives                                     | 0 – 1   |

### Manufacturing Process

The Sika MonoTop®-4012 is manufactured in a conventional mortar plant in Bludenz, Austria.

The raw materials are stored after the quality control testing is passed. The majority of the raw materials are dosed automatically into the mixers after the weighing and dosing phase. If resulting material does not pass the quality test, it will be reworked and send back to the mixing station. After confirming expected results it is send to the packaging station.

## Process flow diagram

## Construction Installation

Sika MonoTop®-4012 is a structural concrete repair mortar that is applied over the prepared concrete substrate after a proper mixing with water. The material can be hand applied or machine applied depending on the volume and area to be applied. The consumption of the material will depend on the roughness and quality of the substrate, as average is 2.1 kg/m<sup>2</sup>/mm. The product is only intended for professional use. Please refer to the product data sheet and method statement for detailed instructions.

## Use Information

During the services life of the building or infrastructure there is no extraordinary maintenance, repair/refurbishment or replacement required, if Sika MonoTop®-4012 is correctly and properly applied.

The high durability and reliability of the structural concrete repair mortar Sika MonoTop®-4012 will limit any repair work to a minimum.

## End of Life

At the end of its service life the building is demolished and as the Sika MonoTop®-4012 is attached to the concrete it is generally taken to landfill. The demolition process concerns mainly the concrete structure of which Sika MonoTop®-4012 is a minor part.

## Life Cycle Assessment Calculation Rules

### Declared unit description

1 kg Sika MonoTop®-4012.

### System boundary

In accordance with the modular approach as defined in EN 15804, this cradle to gate with options EPD includes the product stage (A1-A3), construction process stage (A4-A5), end-of-life stage (C1-C4) and benefits beyond the system boundary (D).

### Data sources, quality and allocation

The primary data provided by Sika derive from the plant in Bludenz, Austria for 2020. Mass allocation was applied to generate data per declared unit of product. Background LCI datasets are taken from the databases of GaBi software and ecoinvent Version 3.7.1. All datasets are less than 10 years old.

Benefits from incineration of packaging are included as benefits in Module D; this also applies to the reuse of wooden pallets.

### Cut-off criteria

All data was taken into consideration (recipe constituents, thermal energy used, electricity used). Transportation was considered for all inputs and outputs. The manufacturing of the production machines and systems and associated infrastructure were not considered in the LCA.

## LCA Results

(MND = module not declared; MNR = module not relevant; INA = indicator not assessed; AGG = aggregated)

|  | Waste for final disposal to landfill   | %                 | 100     |
| Module D                                       | The benefits from incineration of waste produced during installation are credited in Module D as avoided generation of electricity and thermal. The partial reuse of pallets from packaging is also included in Module D as avoided production of new pallets. |                   |         |

## Summary, comments and additional information

### Interpretation

Figure 1 shows the relative contributions of the different modules to the various environmental impact categories and to primary energy use in a dominance analysis.

As can be seen from the results, the product stage (Modules A1-A3) contributes the most significantly to all environmental impact categories and primary energy use. For this reason, the product stage is examined more closely in the following interpretation.

The dominant influence in all environmental impact categories arises from the raw materials involved in the production of the membrane, which represent at least 90% of the impacts in each environmental impact category. The exceptions are ODP, EP-freshwater and PERT. For ODP, 53% of the impacts arise from the production process, 12% from the packaging and 35% from the raw materials. For EP-freshwater, 35% of the impacts arise from the production process, 26% from the packaging and 40% from the raw materials. For ADPE, 10% of the impacts arise from the production process, 17% from the packaging and 73% from the raw materials. For PERT, 10% of the impacts arise from the production process, 29% from the packaging and 61% from the raw materials.

Within the raw materials, the binders play an important role in terms of GWP-total (80%), AP (87%), EP -marine (44%), EP -marine (59%), EP-terrestrial (59%), POCP (66%), and PERT (73%). The influence of the additives can be seen in ODP (100%), EP – freshwater (81%), and ADPE (77%). The influence of the fillers is minimal compared to the other material components, although they make up a relatively high proportion of the total product formulation.
